We need roads, and this is an appropriate way to pay for it.

we need to improve all areas of public transportation

Insufficient facts available to adequately make an informed decision.

A more serious issue is that federal and state gas taxes are too low and federal at least hasn't been raised since, I think, 1994.

Many other taxes (property levy money and much higher license fees in Washington state is already being used to reduce the need to drive

A tax on gas should be used to maintain & build roads!!!

Our roads are in bad shape, if we're not careful, they'll divert road tax funds from fixing roads to something that won't help reducing the need to drive or fixing roads, a lose-lose proposition.

Buy a car that reduces emissions. they would spend the money on other pet projects rather than on roads - they already do.

our roads are a disaster

infrastructure is badly underfunded

Roads are necessary but we need other options too

If paying for gas taxes fix the roads then people who drive a lot pay for taking care of those roads.

My career requires a lot of driving

I don't trust the legislators to keep their word

Q50 The State of California and the Quebec and Ontario provinces have a shared policy that caps emissions, charges large business emitters a fee for their emissions, and reinvests that money on projects to reduce emissions. Evidence from those jurisdictions suggests this to be effective without harming the economy. How much do you support or oppose Oregon and Washington States joining in this policy, for each to do their part and nudge the remainder of the country to join in? Brief methodology:

Survey designed and conducted by PolicyInteractive Research, Eugene, Oregon, in English. Survey funding came from the Institute for Sustainability Education and Ecology in Eugene, Oregon, from a grant provided by the Oregon Community Foundation.

This is a non-statistical sample as defined by the American Association of Public Research because it employs opt-in internet sampling. Internet sampling was chosen for this survey because of declining response challenges and escalating costs of telephone sampling. Across more than five years of direct comparison of telephone to internet sampling, and comparisons with high quality data from very large sample sources, we find that internet sampling has equivalent or superior utility to telephone sampling. One of the purposes of this survey is to extend PI's application and utility of internet surveying.

The average time to take the survey was 13 minutes, although several respondents took much longer. Two sources of respondent participation were employed: a Mechanical Turk (MTurk) panel of 510 respondents and a Research Now (RN) panel of 650 respondents. MTurk draws from a total audience panel of ~500,000, run by Amazon. RN is a world-wide market research company which maintains several panels totaling ~3 million US citizens. In a survey such as this, respondents are rewarded approximately one dollar for taking the survey, similar to inserting a dollar bill as an incentive in a mail-out survey.

Because this survey also intended to test comparability with Pew Research Center survey political typology studies run in 2014 and 2017, most of the initial questions in the PI survey duplicate the text and order of said Pew surveys. However, these differences between Pew and PI typology question design and method limit direct comparison. Some of these differences include:

- Pew's questions contain 2 point 'agree-disagree' answer choices, while PI chose to design them to have 4 point 'strongly agree, lean agree, lean disagree, strongly disagree' answer choices, thus PI response choices allows for greater answer discrimination.

- Pew does not ask but accepts 'other' answers, constituting between one and twelve percent 'non-response' on the question responses, while PI requires answering from the A or B choices. Pew inexplicably assigns this non-response to the conservative answer side of the scale when applied to typology analysis.
- Pew surveys were collected via telephone with a live person, while PI employed an online internet survey platform; these mode differences are known to influence response characteristics.
- Pew's 2017 survey was fielded June & July 2017, while PI's was fielded November and December 2017.

Notwithstanding these differences, for purposes of comparing Pew and PI typology question responses, the PI 4-point answer choices, which duplicate Pew's typology choices, have been combined to two-point responses in the tables above for ease of comparison ('feel strongly' and 'lean' have been combined to one response total). A full modal comparison, faithful to the 4-point answer scale responses, is available on request.

The purpose of this survey included an exploration of combining four states that are hypothesized by other researchers to possess the same political culture as Oregon. Our interest in the four-state combination relates to the possibility of expanding our respondent universe by 1500% because it is often difficult to obtain enough Oregonian internet respondents sufficient for statistical inference. These tables above provide a comparison of the Oregon-only results to the four-state combination. These comparisons provide evidence that the four-state combination is sufficiently similar to an Oregon-only sample, provided that more populated states are proportionalized to Oregon's population characteristics.
